

THE CRISIS IN THE GULF OF MEXICO IS ONLY THE BEGINNING...

**Without a national population policy America
will face future environmental disasters on a regular basis!**

With America racing toward a future where our population will increase to more than 450 million people in just 40 years, we are setting the stage for future social, economic and environmental crises.

Such massive numbers will trigger huge demands for more energy. And while we can dream about more power from wind and solar sources, the reality is that our technology is not expanding as fast as our population.

America's failure to rein-in population growth will only increase the need to drill for more oil and gas, mine more coal, and construct more nuclear power plants – for decades to come. The risks will only multiply. Things will go wrong. People will make mistakes. No technology is fail-safe.

It's not just energy. Massive population growth will fully tax our nation's limited fresh water supplies. Tens of millions of additional people will overwhelm our transportation network, healthcare system, schools and housing. And we'll lose millions more acres of productive farmland and valuable open space.

America can avoid these future catastrophes, but only if our elected leaders adopt a long-overdue National Population Policy that would limit legal immigration, stop illegal immigration, and set guidelines to slow, halt, and eventually reverse U.S. population growth.

Our leaders have been debating a national energy policy for decades and we've made little or no progress. Let's not make the same mistake with population growth.
